LEADERSHIP in ENERGY and ENVIRONMENTAL DESIGN

ELEVATOR

GIVING THE ENVIRONMENT A LIFT!

This elevator is one of the most environmentally sound concepts in the industry through its energy and environmental conservation.

Saving an estimated 20,000 kilowatts of energy per year this energy efficient elevator consumes approximately *HALF* of the energy of conventional traction elevators and *ONE THIRD* the energy of hydraulic elevators.

This elevator, with no hydraulic oil required, removes the risk of over 80 gallons of oil to contaminate soil and start fires that are potential threats in hydraulic elevator systems.

Not only is this an energy saving device, it is a space saver too. Because of its technology, the machinery is integral to the cab so this elevator does not require a separate (and noisy) machine room which saves the space equivalent to an office. More space for the occupants!

Furthering its sustainability theme, this machine is built with 95% recyclable materials so at the end of its life it will never see a landfill!
